Four lawsuits prod polluters to clean up

Companies agree to reduce toxic emissions

In 2017, attorneys representing members of our national network made progress on four major lawsuits against polluting companies.

The impact of the decisions made in these cases will likely be felt across industries, deterring companies from violating environmental laws in other parts of the country.

Given the deep cuts in enforcement funding at the federal level, we’re researching more cases in which companies are jeopardizing the environment by violating the law—and we’re ready to take legal action to stop the pollution when necessary.

1. Texas members v. ExxonMobil
When Environment Texas found evidence that ExxonMobil was releasing illegal air pollution at its Baytown, Texas, facility, our network took Exxon to court.

In April 2017, a federal judge ordered Exxon to pay a $19.95 million penalty for violating the Clean Air Act on 16,386 days, releasing more than 10 million pounds of illegal air emissions, including carcinogens.

2. Fla. members v. Pilgrim’s Pride
Our sister group filed suit against chicken producer Pilgrim’s Pride over discharges of toxic wastewater into Florida’s Suwannee River, which has been plagued by low dissolved oxygen levels and toxic algal blooms.

In November 2017, we reached a Clean Water Act settlement with the agribusiness to cease its pollution, upgrade equipment and pay a $1.42 million penalty for its violations—$1.3 million will be used to improve soil and water quality in the Suwannee Basin.

3. Pa. members v. ArcelorMittal
When residents of Monessen, Pa., complained of noxious odors, ill health effects and sootfall in their neighborhoods, our state affiliate filed suit against ArcelorMittal, the world’s largest steel company, to address hundreds of ongoing violations of the Clean Air Act at the company’s Pittsburgh-area coke plant.

4. Mass. members v. Casella
Our sister group in Massachusetts is in the midst of a lawsuit against Casella Waste Systems, a trash hauler with operations in 40 states, over contamination of drinking water wells and a nearby stream and wetlands. Eighty wells near a Casella-operated landfill in Southbridge, Mass., tested positive for lead and a suspected carcinogen.

We’re working to stop pollution and hold polluters accountable when they violate the laws that protect our environment.
California makes progress on clean energy

Last year, hurricanes battered coastlines across the country and wildfires ravaged California, killing dozens and leaving nearly 100,000 displaced from their homes. It was a stark reminder that climate change is one of the most critical issues of our time. Despite inaction and denial at the federal level, California is making progress to cut pollution, clean up our air, and protect our future.

Last summer, Environment California supported a successful bipartisan effort to expand the state’s landmark cap-and-trade program—an important tool for slashing global warming pollution.

Environment California built a movement in support of Senate President pro Tempore Kevin de León’s bill to commit California to 100 percent renewable electricity by 2045 (Senate Bill 100), holding press conferences in a dozen cities and face-to-face conversations with hundreds of thousands of Californians. The bill now has overwhelming support from 76 percent of Californians, and while the State Assembly deferred a vote on it until 2018, Environment California will continue to work to see it passed.

Transit agencies driving the electric bus revolution

Last fall, Environment California celebrated a major victory when the Los Angeles City Council voted to electrify the city’s bus fleet by 2030, and to power it with 100 percent clean energy. That means no gasoline, no dirty oil changes and no exhaust. For every compressed natural gas-fueled bus we replace with an electric bus, we’ll save up to 170,000 pounds of carbon emissions each year.

Earlier in the year, LA Metro responded to the campaign and committed to a new all-electric bus fleet by 2030. Taken together, the LA Metro and LA City buses represent more than a quarter of all transit buses in California.

In 2018, Environment California and its allies will continue working to secure additional commitments from transit agencies and school districts across the state, bringing zero-emission commuter and school buses to more Californians.

You make the difference

As a member of Environment California, you’re not only helping us defend our clean air, clean water and beautiful open spaces—you’re winning real results for our environment in towns, cities, colleges and universities across our state.

Since our last update, we’ve made real progress in the face of unprecedented challenges. Your support has helped us not only defend the Clean Water Act, but call on local officials to remove lead from schoolchildren’s drinking water. Our global warming team not only defended the Clean Power Plan, but did the research and advocacy it took to strengthen programs that cut carbon pollution from the Northeast to the West Coast.

In 2018, each campaign, each action and each small victory will help bring us another step closer to the greener, healthier world we want to live in. Thank you for making this vital work possible.

The clean energy campuses of the future

America’s institutions of higher education lead the world in scientific breakthroughs. So, it’s only natural for them to lead America’s transition to clean energy.

Colleges and universities serve more than 20 million students and spend more than $15 billion per year on energy, making them the perfect place to drive big investments in clean energy solutions. At the same time, they can train the scientists, engineers, policy makers and civic leaders we need to move the nation toward a sustainable future.

In October, Environment California Research & Policy Center unveiled “Renewable Energy 101,” a series of fact sheets highlighting 10 key tools to help students put their campuses on a path to 100 percent renewable energy.

A course to carbon-free campuses
Pollution-free, virtually inexhaustible, safe and efficient—solar and wind energy are key building blocks of a clean energy future.

Solar energy is so abundant that the U.S. could generate more than 100 times as much electricity from solar installations as it consumes each year. In 2016 alone, wind energy reduced greenhouse gas emissions in the U.S. by an amount equivalent to taking 33.7 million cars off the road.

Colleges and universities operate thousands of buildings across the country on campuses that are sometimes the size of small cities, and students and faculty require transportation between classes, dorms and offices. This makes college campuses ideal places for rapid adoption of 100 percent renewable energy.

Many campuses contain perfect locations for clean energy projects: rooftops, parking lots and even open fields can host solar panels, wind turbines and other clean energy technologies.

By transitioning to clean energy, many colleges and universities can save money while protecting the environment. Wind and solar installations have dropped in price by 85 percent and 66 percent over the last seven years, respectively.

Campus benefits from solar, wind
Many campuses are already reaping the benefits of solar and wind power.

Butte College in northern California became the first in the nation to go “grid positive” in 2011. And by 2016, Arizona State University had the most solar energy of any college nationwide.

Meanwhile, the University of Delaware campus boasts the only commercial-sized wind turbine in the state, allowing it to tap into the East Coast’s immense wind energy potential.

In 2017, our national network won a commitment from Cornell University to achieve 100 percent renewable energy by 2035. Now, we’re working with 50 campuses in 10 states to do the same. Higher education has long played a leading role in bringing technological changes to society. Colleges and universities can continue to lead by embarking on a path to 100 percent renewable energy.

A recent study found that three-quarters of all honey on Earth is contaminated with neonicotinoids, a widely used class of pesticides known to harm bees. Help us build momentum to ban these bee-killing pesticides.

Bee Friendly Food Alliance tops 240

We don’t see many bees flying around in the winter, but we do see the fruits of their labor. Bees pollinate many of the world’s most common crops—so when beekeepers in the U.S. reported losing 33 percent of their honeybee colonies last year, it was clear that losing the bees would have a devastating effect on our food supply.

Last year, Environment California and our national network launched the Bee Friendly Food Alliance, a coalition of chefs, restaurant owners and others in the restaurant industry, to make their voices heard to protect bees. After all, who knows better what we stand to lose without them? And by the end of 2017, more than 240 leaders in the restaurant industry had joined us.

This fall, chefs appeared alongside our staff at media events across the country to shine a spotlight on the Thanksgiving treats made possible by bees, including pumpkin pie, cranberry sauce and green bean casserole. With your support, we'll continue our work to ban the pesticides that are killing bees.
